                                                                                                                                                  à
                                                                                                                                                                                                ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella premoniae, Pseudomonas aeruginosa and Enterococcus facealis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to antibiotic development. The antisense nucleic acids can also be used to dentify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen of wide variety of organisms. The present sequence represents an awide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from NIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAY36754-Y37949 are encoded by open reading frames (ORFS) of the genome of Chlamydia trachomatis (see AAZ01425). The polypeptides can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, and verefactlis, barthollmitis; pneumopathy in breast feeding infants; and vereral lymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases.
                                                                                                                                                                                                                                                                                                                                                     171

Type III secretion systems allow bacteria to target virulence factors directly at host cells. The present sequence is the BSCC protein of B. pertussis. The present protein is encoded by a Class I type gene and is involved in the type III secretion system of B. pertussis i.e. a Bordetella pathogenicity protein. The gene of the present protein is located within a pathogenicity island (see AAA64890). A pathogenicity island see AAA64890). A pathogenicity island is a compact, distinct genetic unit carrying virulence genes. The present protein may be used to treat or diagnose B. pertussis infection, e.g. as a vaccine. Whooping cough is a disease caused by infection by B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 480 SVLIDPATNTLIVTDTRSVIEKFRKLIDELDVPAQQVMIEARIVEAADGFSRDLGVKFGA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          of Chlamydia trachomatiss (see AA201425). The polypeptides can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, nonendemic trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogranulomacosis. The polypeptides of the invention may be of use in treating these diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Vaccine, eye disease; conventional trachoma; nonendemic trachoma; paratrachoma; inclusion conjunctivitis; genital disease; perihepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; bartholinitis; pneumopathy; venereal lymphogranulomatosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAY36754-Y37949 are encoded by open reading frames (ORFs) of the genome

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAY34584-Y25879 represent the proteins encoded by all the open reading frames in the complete genome (see AAX91990) of Chlamydia pneumoniae. C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent citits media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584-Y35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae especially where the vector directs the expression of a neutralising epitope of C. pneumoniae.

```
Chlamydia polypeptides (either in vivo or in vitro) according to standard recombinant DNA methodologies. The polypeptides may then be used to vaccinate against Chlamydia infections in mammals. Chlamydia, such as C. preumoniae, are pathogens responsible for upper respiratory tract infections such as community acquired pneumonia, acute respiratory disease and bronchitis and may be implicated in atherosclerotic changes and achima. The nucleic acids may also be used as probes for detecting the presence of Chlamydia nucleic acids in samples (and therefore diagnose infections) and the proteins may be used as antigens for the production of antibodises that may be used detect Chlamydia proteins in samples (e.g. via enzyme linked immunosorbant assay (ELISA)).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  502

                                                                                                                                                                                                                                                                                                                                                                                                                                              AAY34584-Y35879 represent the proteins encoded by all the open reading frames in the complete genome (see AAX91990) of Chlamydia pneumoniae. C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent officis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY4584-Y35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae.
                                     Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              287 OKVTLKRLINNDTOLIITTAGNWELVNKSAAPGYFTFQVLPKKQNLESGGVNNAPKTFTGR

Sequences ABB90526-ABB90715 represent novel proteins from Chlamydia pneumoniae (strain CML029), and ABL91184-ABL91373 represent DNA encoding them. The proteins are predicted to be immunogenic and may therefore be useful in vaccine production and for diagnostic purposes. Chlamydia pneumoniae is a common cause of respiratory disease in humans, and is also involved in the development of cardiovascular diseases such as atherosclerosis, coronary artery disease, carotid artery stenosis, myocardial infarction, cerebrovascular disease, aortic aneurysm, eludication and stroke. The proteins and nucleic acids of the invention may be used in vaccines and pharmaceutical compositions for the prevention or treatment of chlamydial infections, particularly Chlamydia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Chlamydial infection; antigen; immunogen; vaccine; diagnosis; human respiratory disease; cardiovascular disease; atherosclerosis; coronary artery disease; cardiota artery stenosis; myocardial infarction; cerebrovascular disease; aortic aneurysm; claudication; stroke;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel Chlamydia pneumoniae protein useful in the manufacture of a medicament for treatment or prevention of infection due to Chlamydia, preferably Chlamydia pneumoniae, and for diagnostic purposes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   pneumoniae infections. The proteins may also be used in the detection of Chlamydia pneumoniae, and the nucleic acids may be used in PCR, branched DNA probe assay or blotting techniques for determining Chlamydia pneumoniae gene expression. The present sequence represents a specifically claimed Chlamydia pneumoniae protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              615 VLTQNRKEAKIESGYEIPFTVTSIANGGSSTNTELKKAVLGLTV--TPNIT----PDGQII

biodegradation; Antibacterial, gene therapy, vaccine, biosynthesis, vitamin B12, bacterial infection, disease. ABB47325 standard; Protein; 1711 AA Listeria monocytogenes protein #29 11-APR-2000; 2000FR-0004629 11-APR-2001; 2001WO-FR01118 (first entry) Listeria monocytogenes PASTEUR WO200177335-A2. INSP (TSNI) 05-FEB-2002 18-OCT-2001

The present invention relates to the genome sequence of Listeria

monocytogenes EGD-e (see ABA03041). The genome sequence and fragments of
it are useful for selecting probes and primers for detecting genes in L.

monocytogenes and related organisms, and for studying genetic

colymorphisms and other genomes. The present sequence is a protein

encoded by the genome sequence of the present invention. Proteins

expressed from the genome sequence are useful for raising specific

antibodies, identification of L. monocytogenes and related organisms, and

for insorphisms and biodegradation, especially biosynthesis of Vitemain

B12. The genome sequence and proteins encoded by it are also useful for

selecting compounds that regulate gene expression and cell replication

and modulate L. monocytogenes. related diseases. In addition, the genome

sequence and proteins encoded by it are useful in pharmaceutical and

vaccines compositions for the treatment or prevention of infections by L.

Monocytogenes and related organisms.

Note: The sequence data for this patent din or form part of the printed

specification, but was obtained in electronic format directly from WIPO

sy,

                                                                                                                                                                                                                                                                                                     605
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to isolated polynuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The

polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (1) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleoride sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences of the invention.

Cond to produce other types of data and products dependent on DNA and amino acid sequences of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              à
                                                                                                                                                                                                                                                                                                                                                                                The interior fractions to a mover method tot incentively, isolating and producing hyperimmune serum reactive antigens from a pathogen, tumour, allergen, a tissue or host prone to auto-immunity, where the antigens producing on the preparation from a passam pool of a type of animal, or individual sera with antibodies against the specific pathogen, tumour, allergen, tissue or host prone to auto-immunity. The hyperimmune serum-reactive antigens comprising any of the 62 sequences of 53-261 amino acids fully defined in the specification, or their hyperimmune fragments are useful for the manufacture of a pharmaceutical preparation, particularly a vaccine against staphylococcal infections or colonisation against S. aureus or S. epidermidis. The preparation of antibodies is useful for the manufacture of a medicament for treating or preventing staphylococcal infections or colonisation may also be used for diagnostic and imaging purposes. Other conditions that can be treated include cancer, autoimmune diseases or infections caused by viral (e.g. HIV, hepailtis A, B or C), fungal or protozoan pathogens. This sequence represents a staphylococcal protein relating to the method for identifying and producing pathogen specific antigens of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SKKTAYTNAVQAAKDILNKSNGQNKTKDQVTEAMNQVNSAKNNLDGTRLLDQAKQTAKQQ 3618

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential compared to the concoded proteins. The prokaryotes used are scherichia coli, Staphylococcus aucus, Salmonella typhi, Klebsiella Escherichia coli, Staphylococcus aucus, Salmonella typhi, Klebsiella Compennoiae, Pseudomonas aeruginosa and Enterooccus facealis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express proteins. The proteins can be used to screen compounds in rational drug discovery comportance. The antisense nucleic acid sequence is also useful to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen contain antibodies capable of binding to the expressed proteins. The proteins uncleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

Compound the printed specification, but was obtained in electronic for the printed specification, but was obtained in electronic for the mind in the contain the contain the contain the contain the contain the contain the contain the contain the contain the contain the contain the contain the contain the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contai

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential comparison of genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella cardential coli, Staphylococcus aureus, Salmonella typhi, Klebsiella cheution is also useful for the identification of potential new targets invention is also useful for the identification of potential new targets of can thibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. The proteins can be used to screen compounds in rational drug discovery of programmes. The antisense nucleic acid sequence is also useful to screen control of the monologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

Continued specification, but was obtained in electronic form many directly from WIPO at the printed specification, but was obtained in electronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   30;

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in their use in identifying the comparation of their use in identifying the genes, their use in their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus facefalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen corporation nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an esential prokaryotic cellular proliferation protein.

The invention relates to a method for identifying antigenic polypeptides expressed by pathogenic organisms e.g., Staphylococcus aureus during infection, by SEREX (serological identification of antigens by recombinant expression cloning) techniques. The method involves providing a nucleic acid library encoding genes/partial gene by the library into host cells, contacting the polypeptides expressed by the library into host cells, contacting the polypeptides expressed by the genes with autologous antisera derived from an animal infected with, or has been infected with the pathogen and purifying the nucleic acid encoding the polypeptide or partial polypeptide binding to the antisera. Also included are the nucleic acids and polypeptide in a pathogen and purifying them, a vaccine comprising the polypeptide and the production of monoclonal antibodies against the polypeptide and the production of monoclonal antibodies and antibodies are useful for manufacturing a pathogen microbe. The proteins and antibodies are useful for manufacturing a pathogen microbe condition of monoclonal and antibodies are useful for manufacturing a pathogen where a pathogenic microbe condition of manufacturing and antibodies are useful for manufacturing a pathogen where the production of medicament for treating Staphylococcus aureus-associated septicaemia, the poldermidis-associated septicemia, peritonitis, peritonitis, unperigo, lyme's disease, the invention sequence is an S. aureus protein sequence is aureus protein sequence is a secondar sequence is an aureus protein sequence is a pathogen for manufacturing and antipendia sequence associated with the antigenic contents and antipendia sequence associated with the antigenic contents and antipendia sequence associated with the antigenic contents and antipendia sequence associated with the antigenic contents and antipendia sequence associated with the antigenic contents and antipendia seasociated and antipendia sequence associated with the antigenic contents and antipendia sequence associated w

       invention's also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the express these proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          466
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         194
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               227
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            279 VADFK....-TPVQKV----TLKRLNNDTQLIITTAGNWELVNK-SAAPGYFTFQ 323

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences (I) is useful as hybridisation probes, polypeptide (II) sequences (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for reactor normal activity of (II) is useful in gene therapy techniques (I) and the production of states involving an expressed genes. (I) is useful in or to treat disease states involving contrictating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in disponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and and to produce other types of data and products dependent on DNA and and anno acid sequences and to produce data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to the recombinant production of Haemophilus influenzae high molecular weight (HNW) proteins in Escherichia coli. The expression construct used to effect recombinant expression comprises a promoter functional in E. coli (e.g., the T7 promoter) operably linked to a modified hmwABC operon from a non-typeable (non-encapsulated) H.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Haemophilus influenzae strain LCDC2 mature HMW2A protein, SEQ ID NO:49

                                                                                 ઠે
                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to isolated polymucleotide (I) and polymerase chain reaction (FCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The cand gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving corrections are polymplement. (II) as useful for generating antibodies against it, detecting or (II). (II) is useful for generating antibodies against it, detecting or anod supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical clasorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in classification of mutations in caspondate other types of data and products dependent on DNA and conditionation acid sequences. ABGO010-ABG30377 represent novel human of diagnostic amino acid sequences of the invention.

Conditionation but was obtained in electronic format directly from WIPO conditions in the printed conditions and product data for this patent did not appear in the printed condition of the invention condition of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the invention of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1338

influenzae (NTHi). Most HMW-expressing NTHi strains contain two hmw gene clusters termed hmw1ABC and hmw2ABC. Each hmwABC operon comprises hmwA, hmw and hmwC genes encode the structural HMWA proteins and the hmwB and hmwC genes encode accessory proteins which are responsible for post-translational processing and secretion of the HMWA responsible for post-translational processing and secretion of the HMWA proteins. The modified hmwABC operon used in the expression construct of the invention contains an A gene modified such that it encodes only the mature HMWA. The invention also discloses hmwA genes (AAA52175-A52198) and HMWA proteins (AAB01824-B01849) from the non-typeable H influenzae crarains Joyc, Kl, K21, LCDC2, PMH, 15 and 12. The noulaic acids and vectors are used for the production of recombinant H. influenzae HMW proteins which can be used as vaccines to mediate a humoral or humans caused by H. influenzae (e.g., otitis media, epiglottiis, pneumonia and tracheobronchtis). The HMW proteins and vactore to proteins against diseases in humans caused by H. influenzae (e.g., otitis media, epiglottiis, antigens in immunoassays for detecting antibodies against Haemophilus, HWW proteins and/or HMW peptides. The multipodies against the modified hum genes from other concerns and cracheobronchius and close the sequence scooling the present sequence represents a mature HMWA protein reactions. The present sequence represents a mature HMWA protein from a non-typeable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              583

The invention relates to the recompliant production of Haemophilus CC influenzae high molecular weight (HWW) proteins in Escherichia coli. The expression construct used to effect recombinant expression comprises a promoter functional in E. coli (e.g., the T7 promoter) operably linked to a modified hmwABC operon from a non-typeable (non-encapsulated) H. colinfluenzae (NTHi). Most HWM-expressing NTHi strains contain two hmw gene colsters termed hmw.ABC and hmwZABC. Each hmwABC operon comprises hmwA, hmwB and hmwC genes encode the structural HWMA proteins can the hmwB and hmwC genes encode accessory proteins which are cresponsible for post-translational processing and secretion of the HWMA proteins. The modified hmwABC operon used in the expression construct of the invention contains an A gene modified such that it encodes only the mature HWMA. The invention also discloses hmwA genes (AAAS175-AS198) and HWMA proteins (AAB01824 HB01849) from the non-typeable H influenzae strains Joyc, Ki, Kii, LCDC2, PWHI, 15 and 12. The mucleic acids and strains Joyc, Ki, Kil, LCDC2, PWHI, 15 and 12. The mucleic acids and collimediated immune response to provide protection against diseases in the manner caused by H. influenzae (e.g., otitis media, epiglottiis, colling the migens in immunoassays for detecting antibodies against Haemophilus, antigens in immunoassays for detecting antibodies against Haemophilus. CHWM proteins can be used to isolate and clone hmw genes from other constructs sequence represents an HWMA proteins an on-typeable strains of Haemophilus via hybridisation reactions. The

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antiblotics, the sesential genes themselves and the encoded proteins. The prokaryotes used are consentable to be seen that the consent and the encoded proteins. The prokaryotes used are convention is also useful for the identification of potential new targets invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to invention antibodies capable of binding to the expresse proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen to proteins uncleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aerudinosa and Enterococcus faecalis. The invention is also useful for the identification of potential new targets

for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen a wide variety of organisms. The present sequence is also useful to screen a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               59 SSPARIALDFEQTGISMDQQVLEYADPLLSKISAAQNSSRARLVLNLNKPGQYNTEVRGN 118

New polynucleotides for the identification and development of antibiotics, comprise sequences of antisense nucleic acids -	Example 3: Sed ID No 1	The invention relates to antisense inhibitors of denes essential to	prokaryotic cellular proliferation, their use in identifying the	genes, until use in the discourt, or included the prokaryotes used are recherchis coli standardocus aureus. Salmonella tvohi. Klebsiella	pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The immediate in also needly factors the identification of notential new targets	for antiblotic development. The attendance nucleic acids can also be used	to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins.	programmes. The antisense nucleic acid sequence is also useful to screen	ior nomologous nucleic actus which are required to text prointeraction in a wide variety of organisms. The presents sequence represents an	Lessential proxizour centural profitations process. Note: The sequence data for this patent did not form part C of the printed specification, but was obtained in electronic

                                                                                              ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the sesential comes, their use in the discovery of novel antibiotics, the sesential comes, their use in the discovery of novel antibiotics, the sesential commonial tenterion is also useful for the identification of potential new targets invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acid sequence is also useful to screen corporate the sequence drug discovery programmes. The nucleic acid sequence is also useful to screen corporate the sequence drug for an antisense nucleic acid sequence represents an essential prokaryotic cellular proliferation protein.

Compared the printed specification, but was obtained in electronic format directly from MIPO at the printed proliferation, but was obtained in electronic ceptures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1770 SIANKDDVKAS-----QPYVDADRDKQNAXNTAVTNAENİINATSQPTLDPSAVTQAANQ 1824

                                                                                                                                                                    The invention provides proteins (AAY27201-245) from Neisseria meningitidis (strains A and B) and nucleic acid sequences (AAX99123-167) encoding the proteins. Compositions comprising the protein, nucleic acid or antibody specific to the protein are useful as pharmaceuticals, e.g. a vaccine composition or a diagnostic composition. The composition is also useful for treating or preventing an infection due to Neisserial bacteria, especially Neisseria meningitidis.
